

EVM User's Guide: LMK6EVM, LMK6C, LMK6D, LMK6H, LMK6P

LMK6x Evaluation Module

Description

The LMK6x evaluation module (EVM) is a platform for evaluating the performance of the LMK6x family of high-performance bulk acoustic wave (BAW) oscillators. BAW is a microresonator technology that enables the integration of high-precision and ultra-low jitter clocks directly into packages that contain other circuits.

Features

- Fixed-frequency oscillator using TI's BAW technology
- Supports standard 3.2mm × 2.5mm and 2.5mm × 2mm, 4-pin or 6-pin package oscillators
- Low output jitter
- Supply voltage options of 1.8V and 2.5V to 3.3V

1 Evaluation Module Overview

1.1 Introduction

The LMK6EVM provides a complete evaluation platform to evaluate the clock performance and flexibility of the Texas Instruments LMK6x Ultra-Low Jitter BAW Oscillator family. This EVM can be used as a flexible clock source for compliance testing, performance evaluation, and initial system prototyping. The onboard edge-launch SMA ports provide access to the configurable clock output of the LMK6x, which allows the device to interface with test equipment and reference boards using commercially available coaxial cables, adapters, or baluns (not included).

The LMK6x is a lower-power clock oscillator using TI's BAW technology. The LMK6x is available in two package sizes, DLE (3.2mm × 2.5mm) and DLF (2.5mm × 2.0mm), and four different output formats: LVCMOS, LVPECL, LVDS, and HCSL. Both footprints are included on the EVM with independent termination networks. The termination scheme can be modified by the user for the desired output format.

Note

The LMK6EVM is not populated with an LMK6x device by default. The user can choose the desired oscillator variant for evaluation. Contact TI to pre-order specific LMK6x device variants at ti_osc_customer_requirement@list.ti.com.

1.2 Evaluation Module Contents

The box contains:

- One LMK6EVM board (DCC222A)

1.3 Evaluation Setup Requirement

The evaluation requires the following hardware:

- DC power supply or USB power supply
- Oscilloscope
- Signal analyzer (optional)
- LMK6x device

2 Hardware

2.1 Setup

2.1.1 Connection Diagram

Figure 2-1 shows the LMK6EVM (DCC222A) connection diagram. To test LMK6xDLF variants (DLF 2.5mm × 2.0mm package), the device must be soldered on Y1, and P1 and P2 can be connected to an oscilloscope or phase noise analyzer to evaluate the device output. Similarly for LMK6xDLE variants (DLE 3.2mm × 2.5mm package), the device must be soldered on Y2, and P3 and P4 used accordingly to measure the output. Note that for LMK6C variants with an LVCMOS output format, only the positive clock output connection is used. The 4-pin LMK6C variants can share the same footprint as the 6-pin LMK6D/P/H variants. The corner pins are shared, but the middle pins are left unused for the LMK6C devices.

Figure 2-1. Connection Diagram

2.1.2 Power Supply

Apply 4V to the EXTIN SMA connector (P5), or supply 5V via the mini USB connector. The onboard voltage regulator provides 1.8V, 2.5V, or 3.3V to the LMK6X devices based on the jumper selection on J6. The external supply connected to P5 can also directly supply voltage to the LMK6x device by shorting pins 1 and 2 on J8.

2.1.3 Clock Output

To test the clock output of Y1, connect P1 (+) and P2 (–) SMA connectors to an oscilloscope or phase noise analyzer. To test the clock output of Y2, use P3 (–) and P4 (+). The output frequency, amplitude, and common-mode voltage depends on the LMK6x variant that is attached to the board, as well as the termination scheme.

2.1.4 EVM Strap Options

2.1.4.1 J1 Header

Put the short across J1 to provide the supply voltage to Y1.

2.1.4.2 J2 Header

J2 is used to pull pin 1 and pin 2 of Y1 to VDD/GND to select the output enable (OE) pin of the LMK6x device. 6-pin LMK6xA/LMK6xE variants use pin 1 for OE, and LMK6xB/LMK6xF variants use pin 2. All 4-pin LMK6C variants use pin 1 for OE.

2.1.4.3 J3 Header

Put the short across J3 to provide the supply voltage to Y2.

2.1.4.4 J4 Header

J4 is used to pull pin 1 and pin 2 of Y2 to VDD/Gnd to select the output enable (OE) pin of the LMK6x device. 6-pin LMK6xA/LMK6xE variants use pin 1 for OE, and LMK6xB/LMK6xF variants use pin 2. All 4-pin LMK6C variants use pin 1 for OE.

2.1.4.5 J6 Header

J6 is used to select the output voltage of the onboard voltage regulator.

2.1.4.6 J7 Header

J7 selects the input voltage source for the onboard regulator. Short pins 1 and 2 to use an external supply connected to the SMA connector P5. Short pins 3 and 4 to use a USB supply.

2.1.4.7 J8 Header

J8 selects the input voltage source for the LMK6x device. Short pins 1 and 2 to use an external supply directly. Short pins 3 and 4 to use the output from the onboard voltage regulator.

2.1.5 Configuring the Clock Output Termination

The LMK6EVM comes pre-populated with an AC-coupled LVCMOS termination. The termination can be modified by the user to support LVPECL, LVDS, and HCSL output formats according to the component values in the table below.

Table 2-1. Output Termination Schemes for Y1

OUTPUT FORMAT	COUPLING	COMPONENT	VALUE
LVPECL	AC	R1, R5	0Ω
		R2, R4	210Ω
		C1, C4	0.01μF
		R3	DNP
	DC ⁽¹⁾	R1, R5, C1, C4	0Ω
		R2, R3, R4	DNP
LVDS ⁽²⁾	AC	R1, R5	0Ω
		R3	100Ω
		C1, C4	0.01μF
		R2, R4	DNP
	DC	R1, R5, C1, C4	0Ω
		R3	100Ω
HCSL	AC	R1, R5	0Ω
		R2, R4	50Ω
		C1, C4	0.01μF
		R3	DNP
	DC	R1, R5, C1, C4	0Ω
		R2, R4	50Ω
		R3	DNP

(1) 50Ω to Vcc – 2V termination is required on the receiver.

(2) 100Ω differential termination (R3) is provided on the LMK6EVM. Removing the differential termination on the EVM is possible if the differential termination is available on the receiver.

Table 2-2. Output Termination Schemes for Y2

OUTPUT FORMAT	COUPLING	COMPONENT	VALUE
LVPECL	AC	R10, R16	0Ω
		R11, R15	210Ω
		C5, C8	0.01μF
		R12	DNP
	DC ⁽¹⁾	R10, R16, C5, C8	0Ω
		R11, R12, R15	DNP
LVDS ⁽²⁾	AC	R10, R16	0Ω
		R12	100Ω
		C5, C8	0.01μF
		R11, R15	DNP
	DC	R10, R16, C5, C8	0Ω
		R12	100Ω
HCSL	AC	R10, R16	0Ω
		R11, R15	50Ω
		C5, C10	0.01μF
		R12	DNP
	DC	R10, R16, C5, C8	0Ω
		R11, R15	50Ω
		R12	DNP

(1) 50Ω to Vcc - 2V termination is required on the receiver.

(2) 100Ω differential termination (R3) is provided on the LMK6EVM. Removing the differential termination on the EVM is possible if the differential termination is available on the receiver.

3 Implementation Results

3.1 Typical Measurement

3.1.1 Phase Noise

Figure 3-1 shows the typical phase noise for the LMK6EVM populated with the 156.25MHz variant of the LMK6H/LMK6P.

Figure 3-1. LMK6EVM Phase Noise

4 Hardware Design Files

The schematic diagram illustrates the LMK6000 evaluation board, showing two versions: LMK6XDLE (2.5 x 2.0mm) and LMK6DLE (3.2 x 2.5mm). The diagram includes power supply connections, signal traces, and termination options for LVPECL and LVDS signals.

LMK6XDLE - 2.5 x 2.0mm

LMK6DLE - 3.2 x 2.5mm

LVPECL termination

LVDS termination
Option to probe
